JOLIBEN

PROJECT WORK SAMPLE

Thiemo Gerhardt | October 2026

Practical AI. Reviewable results.

JOLIBEN is my independent AI and product-development project. I explore and design how AI assistance can become a traceable workflow with deliberate human decisions.

MY ROLE

Thiemo Gerhardt

Initiator & Product Owner

IT background and entrepreneurial experience. My focus is on product direction, requirements, priorities, AI collaboration and the substantive assessment of results.

From a problem to a verifiable result

An AI suggestion alone does not establish whether a task has been handled appropriately. JOLIBEN therefore focuses on the transitions: What is our goal? Which context matters? What boundaries apply? How do we assess the result?

What I take responsibility for

Product thinking	Structure requirements and prioritise development steps.
AI collaboration	Guide and bound implementation with AI tools.
Quality	Define acceptance criteria and critically assess evidence.
Communication	Explain progress and open questions clearly.

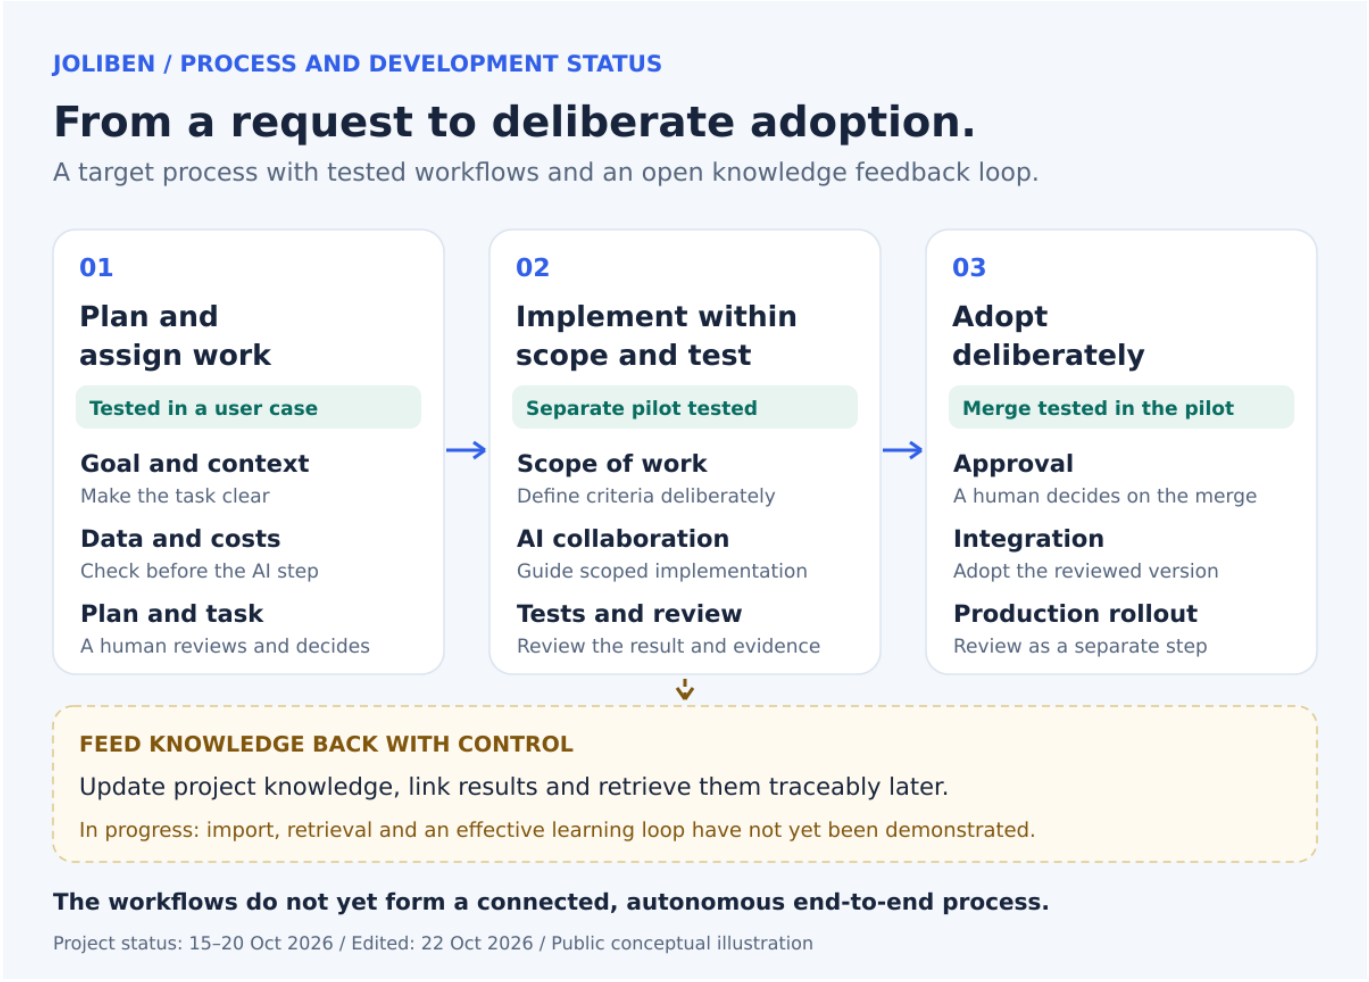

Implementation and technical analyses are carried out with AI tools. This work sample demonstrates my product responsibility and how I assess the resulting work.

Deutsche Fassung / DE

A clear process.
An honest view of progress.

Selected component workflows have been tried out. Fully connecting them and building controlled knowledge feedback remain development work.

A documented development case

A bounded task progressed from failure reproduction through an AI-assisted correction to review and human-approved integration.

16 selected checks passed

Documented scope of this case; not the complete test suite.

Project state on 20 October 2026: merge documented; production rollout was outside this cycle. Test figures are from the report at the time, not a new run. Public agent view: explanatory simulation without live AI. Application code remains private.
