Develop with control. Review the evidence. Decide deliberately.

A bounded reliability fix progressed from failure reproduction through an AI-assisted correction to reviewed, human-approved integration.

THE DECISIVE POINT

Two new checks exposed the intended difference before the correction. After the focused fix, the relevant checks passed. Review and human approval preceded integration.

01 / Bound the task

Define the goal, scope of changes and appropriate checks.

02 / Make the difference visible

Existing baseline: 6 passed. Two new checks: 2 failed, 6 passed.

03 / Correct and verify

After the fix: 8 passed. Expanded selected regression: 16 passed.

04 / Review and integrate

Assess change and evidence together. Integrate through a pull request after human approval.

Case state: 20 October 2026. PDF edition: 23 October 2026. Reported test figures, not a new product test run. Production rollout was outside this cycle.

Evidence with a clear scope.

The reported sets of checks overlap. They are not added together, and the selected regression run does not represent the entire repository test suite.

6 passed

Existing baseline.

2 failed / 6 passed

Two new checks against the previous behaviour.

8 passed

The relevant checks after the targeted correction.

16 passed

Expanded, selected regression run.

Human-approved merge

Change accepted after review. No production rollout within this cycle.

MY ROLE AS INITIATOR AND PRODUCT OWNER

I define the goal and acceptance criteria, guide collaboration with AI tools and oversee the assessment and acceptance of results. Implementation and technical analyses are carried out with AI tools.

Based on the public case summary and the development record of 20 October 2026. Merge status was checked on GitHub on 22 October. This is limited evidence; applying it to other tasks and connecting the whole workflow remain development work.
