FROM AN AI SUGGESTION TO DELIBERATE TASK CREATION

From a request to a traceable task.

How JOLIBEN connects a proposed plan to a real task and keeps the human decision about the next step visible.

THE REQUEST

Examine an existing software area and summarise the findings in a report.

Simplified account of the documented internal review case; not an original quotation.

What existed at the end of the demonstrated workflow

PLAN	TASK	SOURCE
Proposal with preserved provenance	**Deliberately created** and assigned	**Original plan stays** traceable

The plan is preserved. The human decides what comes next.

The substantive examination of the project area was not authorised or performed for this task. The transition to a completed findings report remained open in the documented state.

Case state: 19 October 2026. Public account: 22 October 2026. English edition: 23 October 2026. Based on dated project reports and their account of the user browser case.

Explore the project **GitHub work samples**

Six steps.
Three deliberate decisions.

The workflow describes one selected internal review case. This overview illustrates the product principle; it is not an application screenshot.

01 **Describe the request** — USER

An existing project area is to be examined.

02 **Review context and approval** — USER

Make selected context, data and costs visible.

03 **Inspect the AI plan** — AI / USER

Assess the proposal before creating a task.

04 **Choose the project deliberately** — USER

Explicitly assign the task to the appropriate project.

05 **Confirm the task** — USER

Create the task following a deliberate decision.

06 **Trace the original plan** — SYSTEM

The unchanged source remains readable at the task.

Each decision has its own scope

1 / Planning

Review context, data and costs for the particular AI step.

2 / Task creation

Deliberately confirm the project assignment and task creation.

3 / Further work

Clarify the type of work and its boundaries separately. Open in this case.

The key finding was at the handover.

A task existed and its plan source remained traceable. For the desired read-only findings report, however, the next work step still needed to be clarified appropriately.

DOCUMENTED

The selected planning workflow, deliberate project assignment, created task and preserved original source. The inventory review confirmed the existing task and its plan source.

STILL OPEN

The complete path from this task to a finished read-only examination, a stored list of findings and appropriate acceptance of the result.

Three requirements for the next step

Specify the result

Which findings and evidence should the report contain? The criteria must match the intended result.

Choose the right type of work

Explicitly distinguish a read-only examination from implementation that changes the system, and define its boundaries.

Preserve provenance

Keep the original plan visible. Present new criteria as a traceable refinement.

The first two points and further refinement remain development work. Preservation of the original plan is documented for this case.

What this case study shows about my work.

As initiator and Product Owner, I connect problem definition, requirements and the substantive assessment of results. Implementation and technical analyses are carried out with AI tools.

Problem definition

Connect a short review request with context, the intended result and task assignment.

Product Ownership

Clarify the transition from plan to task and identify requirements for subsequent work.

AI collaboration

Place AI assistance within a bounded, understandable workflow.

Quality orientation

Assess the available evidence and describe the demonstrated part of the workflow precisely.

SOURCES AND SCOPE

Based on internal project reports dated 15 and 19 October and the status update of 20 October 2026. This case refers to 19 October 2026. Browser confirmation is attributed to the user. No models or product tests were run for this account.

The case offers a design approach for AI-assisted tasks. It does not demonstrate a general quality improvement, time saving or customer deployment.
